

UNISIN DAS

Dicyandiamide based tanning resin

Typical Analysis

Appearance	: Beige Powder
Active Substance	: 93-97 %
pH (10% sol.)	: 8.0 ± 0.5
Ionic Character	: Anionic

Properties

Unisin DAS is a resin with high affinity for chrome tanned leathers. Its application is for selective filling of leather structures like flanks and bellies. **Unisin DAS** results in a fine and firm grain with low leather elasticity, which is highly important for buffed articles, nubuck and glazed leathers. In order to obtain the best results we suggest using **Unisin DAS** after neutralization in a low float, either alone or before retanning with synthetic and natural tanning.

Application

Unisin DAS can be used between 2-4 % on shaved weight for sheep skin, nappa; and 2-6 % on shaved weight for shoe upper leather during the retannage process.
